01.- MOTIVATION

At the end of forming it is usual to **trim the formed part** to achieve final shape or to remove edge micro-cracks

Due to plastic deformation during forming **residual stresses** are generated

After trimming there is a **redistribution** of the residual stresses and **displacements** to achieve a new equilibrium

It is necessary to define accurately the trimming line to be able to assess the new state

02.- GENERAL VIEW

0) At the end of forming

there are defined:

-Part **geometry**

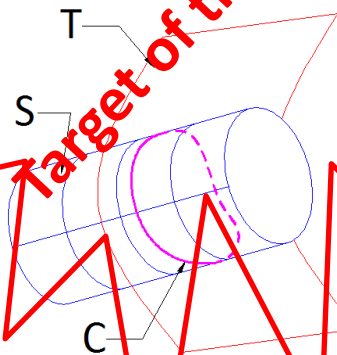

-**Material properties**

-**Residual stresses** $\{\sigma_0\}$

Stored in **surface model "S"**

1) Surfaces **S-T** intersection is computed, the output is a trimming curve **"C"**

2) A portion of **S** is **removed and then deactivated** for subsequent calculations as [1]. The remaining surface is called **"St"**

(Definition of trimming surface **"T"** - NURBS surface)

3) Control points forces due to residual stresses and stiffness matrix are calculated using the remaining area of **S** (**St**) in the integrals

$$\{f_{ecp}\} = - \int_V [B]^T \{\sigma_0\} dV$$

$$\{K_e\} = \int_V [B]^T [D][B] dV$$

4) Final configuration

- 03.3.- Row of intersection points
- 03.4.- Curve fitting
- 03.5.- Definition of remaining surface

I.- Calculate a row of S-T intersection points (iterations required for each intersection point calculation)

II.- Fit a curve to the row of intersection points but in **S parameter space**

03.- TRIMMING CURVE DEFINITION

03.1.- Strategy

03.2.- T surface requirements

03.3.- Row of intersection points

03.4.- Curve fitting

03.5.- Definition of remaining surface

Trimming T surface has to:

Be smooth (derivable)

Trim the metal sheet in the physical space

The resulting trimming curve has to enclose a portion of S surface

Extend slightly further than the intersection between the two surfaces

Be open surface

03.- TRIMMING CURVE DEFINITION

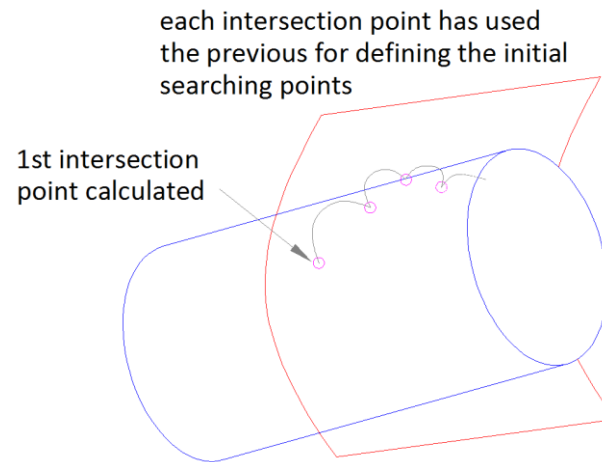

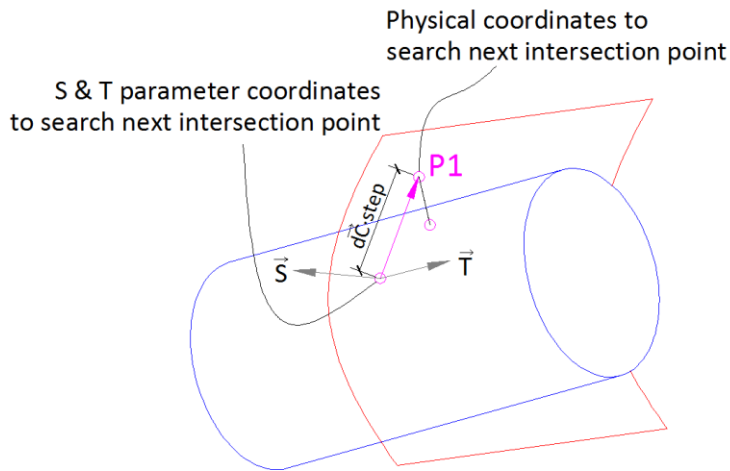

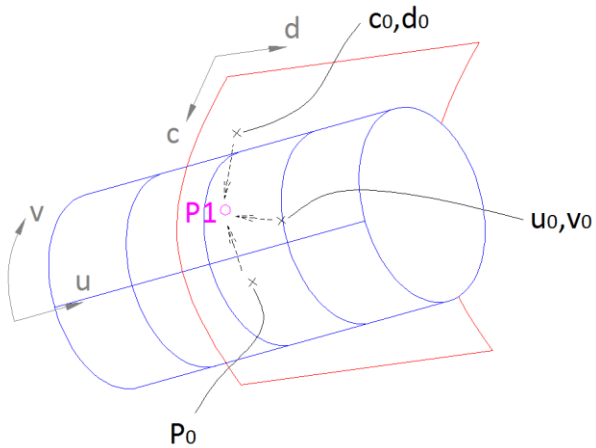

03.1.- Strategy

03.2.- T surface requirements

03.3.- Row of intersection points

03.4.- Curve fitting

03.5.- Definition of remaining surface

03.- TRIMMING CURVE DEFINITION

03.1.- Strategy

03.2.- T surface requirements

03.3.- Row of intersection points

03.4.- Curve fitting

03.5.- Definition of remaining surface

Function [X,s,t]= **RowInterPoints** (P0 , u0,v0, c0,d0 , S,T , step)

P1 = P0 % transfers
Suv1 = (u0,v0) % initial searching
Tcd1 = (c0,d0) % points

Initial searching
point

Surfaces
parameters

Step to calculate next
searching point

i=1

While Dx > tolerance

P2,Suv2,Tcd2 = **intersection** (P1,Suv1,Tcd1) % computes the closest intersection point to searching point P1.

X(i) = P2 ; s(i) = Suv2; t(i) = Tcd2

% transfers intersection point to answer arrays

Suv1 = Suv2 ; Tcd1 = Tcd2

% updates initial searching points in S and T parameter spaces

dC = derivative(P2,Suv2,Tcd2)

% calculates next physical coordinates of searching point using

P1 = P2 + dC*step

% the derivative at the latest intersection point and the step

Dx = abs(|X(i) | - |X(i-1) |)

% calculates the distance between the two latest intersection points
% if is zero means that the edge of S surface is reached and the loop halts

i = i+1

End while

End function

[2] Piegl L, Tiller W. *The NURBS Book*. Berlin. Springer-Verlag, (1996).

03.- TRIMMING CURVE DEFINITION

Direction of curve is given by
cross product of surfaces S
and T normal vectors

$$d\vec{c} = \vec{S} \times \vec{T}$$

03.1.- Strategy

03.2.- T surface requirements

03.3.- Row of intersection points

03.4.- Curve fitting

03.5.- Definition of remaining surface

Surface on the left hand side
of the trimming curve remains

Surface on the right hand
side is to be removed

05.- EXAMPLES

06.- POTENTIAL IMPROVEMENTS

04.- STIFFNESS MATRIX AND FORCES

Already developed for trimmed 2D surfaces by Kim *et al.* [1]. Here we proceed in a similar manner

When computing $[K_e]$ and $\{f_{ecp}\}$ at each element:

- **Ignore** totally deactivated elements
- For trimmed elements: **divide** into triangles remaining area and integrate those triangles
- Integrate in a **standard** manner totally in elements

Then the control points displacement are calculated and afterwards the stresses

05.- EXAMPLES

06.- POTENTIAL IMPROVEMENTS

06.- POTENTIAL IMPROVEMENTS

Algorithm to select the initial searching points

Allow trimming surface to be closed
(simulate holes)

Non-derivable trimming surfaces

06.- POTENTIAL IMPROVEMENTS

**Remove trimming curve dependency on step
(step length selection)**
